

## **GR Construction Management Services – Pressure Testing Division: A brief history**

*In our many years as pipeline inspectors we saw the need for professional grade pressure testing in the industry.*

*We saw the need for qualified personnel and quality equipment. We saw the inefficiencies in finding both, especially when time is short. GRCMS set out to raise the quality and status of pressure testing. We believe we have accomplished that.*

*GRCMS created mobile units capable of testing a wide range of pressures using a variety of mediums. We offer our service as turnkey or we will handle any part the client wishes us to handle.*

*We hire and train people that are more than technically good. They are also good communicators at all levels, in the field or with the client.*

*We have safely and successfully completed hundreds of pressure tests.*

*We accomplished this with redundant pressure records and accurate documentation.*

*We believe in leaving the client confident that their pipeline is safe and ready to carry product.*

## **Services**

Pipeline Inspections  
Compressor Station Inspections  
Project Management  
Pipeline and Pressure Vessel Testing  
Pipeline Pigging, Cleaning and Drying  
Completed Report Manuals  
Digital Gauge Reports that meet DOT Standards

## Hydrostatic Testing

Pressure or hydrostatic testing is a way to test pipelines and other vessels for strength and integrity. It is the most common method for testing pipelines and associated vessels for integrity.

Pressure test can expose defects in materials and workmanship.

Use pressure testing for post-construction or to re-qualify the pipeline per D.O.T. Standards.

Integrity is the Key:

We offer testing tailored to your needs.

We can handle water management from supplying to disposal.

We'll make sure the fill water and recovered water are measured accurately. What went in must come out!

### Our Staff:

We have our own safety policies and we work under the customer's policies as well. We hold our own tailgate safety meetings and include people that may be affected by our work. Our staff are Operator Qualified (O.Q.'d) through Veriforce and Energy U.

## Pressure Testing Services

Our technicians are well versed in a variety of test mediums. We are equipped to test with water, air and nitrogen. Our test trailers are self-contained and have redundant measuring systems.

We use state of the art gauges with mainstream chart recorders, all verified with dead weights. All our work is recorded to meet your requirements and DOT audits.

### We offer testing services which include:

Producing test procedures for your approval.

Filling and de-watering the line.

Pigging and drying.

In some cases the client wants to do a part of the work, and we handle the rest.

We test small fabrication projects in fab shops and multiple large, long lines in the field.

## Pigging services

We offer pigging services for more than line drying.

Pigging can reduce the chances of future problems with your line.

We coordinate:

- Smart pigging,
- Caliper pigging
- Other pigging procedures.
